

blogging positively

Street art found in Burma to spread awareness about HIV and AIDS. The flow of information in Burma is monitored, censored, and restricted. *HIV Information for Myanmar* uses a blog to make it available. him.civiblog.org

Introduction: "Blogging Positively"

The "Blogging Positively" Guide is the brainchild of bloggers seeking to address the HIV/AIDS pandemic in a meaningful way. Citizen media tools – including blogs, podcasts, and online photo and video sites – present powerful new opportunities for activists aiming to spread awareness and promote discussion about HIV/AIDS and its societal stigma.

There are many ways in which blogging is a valuable tool for discussions and activism around HIV/AIDS, including: 1) what you post is part of a permanent, stored record; 2) audiences are potentially global; 3) personal interactions take place at many levels, from the local to the international; 4) anonymity is possible, and not necessarily an impediment to influence; 5) replication and remixing make for

creative storytelling; and 6) conversations can be both synchronous (real time) and asynchronous (across different time periods).

There are also some potential disadvantages to blogging that are important to keep in mind, including 1) the risk of spreading misinformation; 2) susceptibility to online or offline negative comments; and 3) the necessary access to a computer, Internet connection, and electricity.

In our research on HIV/AIDS blogging, we have discovered at least 200 bloggers worldwide, many living with HIV/AIDS, who regularly write about HIV/AIDS-related topics. Our interactive map (link below) lists bloggers we have identified, and we welcome additions to the directory.

In This Guide:

Why blog about HIV/AIDS?	2
For new bloggers	3

Case studies	6
Getting started	7
Advice from a veteran	8

Rising Voices is a citizen media outreach initiative of Global Voices [www.globalvoicesonline.org]. By connecting passionate bloggers, podcasters, and video-makers from around the world, we hope that every neighbor from every neighborhood is able to participate in the online conversation that is spreading across the globe. This guide - *Blogging Positively* - is the second in a series of publications meant to make the world of participatory media easier to understand and take part in. Please also see our [Introduction to Citizen Media](http://rising.globalvoicesonline.org/guides): <http://rising.globalvoicesonline.org/guides>

A map of HIV/AIDS bloggers around the world. Updated version available at <http://globalvoicesonline.org/specialcoverage/world-aids-day-2008/>

This guide has evolved in part through a series of chats attended in 2008 and 2009 by a wide-ranging group of people: veteran and novice bloggers; people from cities and rural areas; those from developed and developing countries; some with steady computer and Internet access, many with only minimal access; people who are HIV-positive, and those who are HIV-negative; those working in the HIV/AIDS field, and people working in other fields, such as technology, harm-reduction, the arts, and secondary education.

What we all have in common is a desire to learn more about how technology can be utilized to improve human health and well-being, and how citizen media might effectively address HIV/AIDS. We hope this labor of love will be helpful as you find your own voice and your own ways of coping with, challenging, and defeating HIV/AIDS. The title of the guide, coined by Kenyan blogger Daudi Were, thus has multiple meanings: We hope it will be useful for people infected and affected by HIV/AIDS, and that it will also be helpful to those who aim to spread more awareness about prevention, healthy living, and human rights.

What is Blogging?

The word "blog" is short for weblog and refers to a type of website that is updated chronologically. You can think of a blog just like email. Except, instead of sending an email to just one person, you are publishing the note on a website where it can be seen by anyone in the world with an Internet connection.

Most blogs allow for comments, enabling readers to ask questions or add their own opinions to what you publish. This is how a conversation begins - one person writes his or her opinion and then others add to the conversation. Some of the most popular weblogs receive over 100 comments every time something is published, but the vast majority of blogs are written for an audience of just a handful of readers with similar interests.

Why Blog about HIV/AIDS?

Personal stories are often a central focus of blogging. They can help inform and educate readers, enhance activism, and inspire change. Bloggers can tell the personal stories of individuals, rather than resorting to broad stereotypes or statistics.

Bloggging about one's HIV status or the challenges of living with HIV/AIDS can be empowering, both for the blogger and his or her readers. A blog can be a safe space that is usually free from discrimination. Someone applying for antiretroviral treatment, for example, might explain the process to others. Or that same person could create a digital "Memory Book" for families and loved ones to preserve family history and strengthen the bonds of those who remain.

Most people who blog about HIV/AIDS have education and prevention as primary goals. Some have a more

Blogging Anonymously

There are many reasons to blog under your real name, including credibility, honesty, and reputation. But some people live in places or under conditions where what they write could threaten their safety. For this reason, Global Voices has put together a guide on how to blog anonymously and hide your identity online.

advocacy.globalvoicesonline.org

Protect Human Rights

WITNESS Video Hub is a participatory website where anyone, anywhere can upload media related to human rights that can be used to create change. If you have witnessed police brutality, or any other kind of human rights abuse, and captured it on your cell phone or video camera, here is a way to safely and anonymously document what happened and help put an end to it.

hub.witness.org

spiritual focus, while others talk frankly about sex, symptoms, and stigma. Political advocacy is important to many bloggers as they advocate for greater access to treatment, support programs, and health-related capacity building.

For New Bloggers:

If you are blogging for the first time, consider starting with an easy, familiar topic that isn't necessarily related to HIV/AIDS. After feeling comfortable with blogging it should then be easier to address issues related to the pandemic.

Most new bloggers will feel more at ease when starting slowly, one step at a time, but others might be ready to dive right in.

It may also help to think about your audience as you write. You might want to start by imagining an audience you are already familiar with, then expand your range as you gain more confidence. Keep in mind that anything you publish on your blog can potentially be seen by millions of people. In practice most blogs only have about a dozen readers, but it is important to keep the public nature of blogging in mind when you choose what to publish. It is always best to ask a friend's permission before publishing a story or memory about him or her. If you would like children to see your blog it is important to think about what is and isn't appropriate for them to read.

Eventually you may also want to think of ways to spread your message to those who cannot read. Visual communication – including videos and photographs – can help bring your message to more people. For those who are vision-impaired, music and audio recordings can be used to communicate your message.

A blog post does not have to be a long, scholarly, or polished piece. Informality is a mainstay of blogging. What is most important is that you enjoy the process and feel good about what you have created.

For Facilitators and Teachers:

If you are helping others publish content to a blog, encourage them to

Nata Village's Ntwakgolo Support Group

Nearly one in four adults in Botswana is HIV-positive, and the United Nations has estimated that by 2010 more than 20 percent of all children in Botswana will be orphaned as a result of the HIV/AIDS epidemic. In the small rural village of Nata 20 activists are living openly with their HIV-positive status to confront the stigma that surrounds the pandemic.

In Setswana (the official language in Botswana), "Ntwakgolo" means "Great War," an appropriate name for the battle being waged against HIV/AIDS in

Nata. Members of the Ntwakgolo Support Group are among the first people to openly identify as HIV-positive within their communities. By their example, they are encouraging others to live more openly, too.

The Nata Village weblog began in 2006 when a tech-savvy traveler met a local HIV/AIDS educator in the rural Botswanan village. The blog has raised tens of thousands of dollars and is now sustained by local staff at the Nata AIDS and Orphan Trust.

<http://is.gd/1B229> | <http://is.gd/1B1Og>

REPACTED

REPACTED was formed in 2001 to encourage young people to get involved with community development through participatory theater, awareness campaigns, peer education and counseling. REPACTED addresses HIV/AIDS, substance abuse, peace and conflict resolution, and sustainable development.

In 2008 they started the Youth Media Consultative Forum, which collects news and stories from communities in and around Nakuru, Kenya and posts them on the Internet, allowing local residents to show the true picture of their community. REPACTED has trained over 20 staff members and community leaders how to blog and produce multimedia content. Those who have already been trained are asked to reach out to 20 friends, including young people who are still gang members.

<http://repacked.org>

contribute topics that both come from the heart and that also inspire discussion. This should help beginners relax. Though advanced aspects of blogging can be technically daunting, it is best to keep things simple, easy, and fun for new bloggers.

Encourage collaboration. Remind new bloggers to comment on the posts published by their peers. Sometimes it is also helpful to write a "guest column" on someone else's blog. Many different bloggers can also contribute to one group blog, which encourages a sense of teamwork.

If you have time, start a blog yourself, and create links to the blogs of your students, or link their blogs to your already-existing blog. If you can find fellow teachers or facilitators who specialize in creative writing or storytelling, you might ask them to be of assistance. They may know techniques for getting people to relax and enjoy the creative process. They may also be more available than often-overworked health or service-organization personnel. Schools and libraries might also have good human and/or technical resources.

Think about how to create more opportunities for those who are not Internet-fluent. In Uganda, the PeerLink project [<http://www.geocities.com/peliug/index.htm>] links learning about HIV/AIDS. Urban students, who tend to be computer savvy, are paired with young people in rural schools, who often lack both equipment and knowledge about computers, as well as Internet access. The urban-based young people help their rural peers gain access to computer equipment and the Internet, and then give computer tutorials to the rural students. Both groups then engage in mutual learning about HIV/AIDS.

Q & A for Teachers or Facilitators

How can we encourage young people, women, people with disabilities, people living with HIV/AIDS, and others who often are marginalized? If people come to you, create a safe physical space for them to begin their blogging experience. Otherwise, do outreach to organizations working with these populations, promoting the idea of

blogging as an empowering and educational tool.

How can we engage people living in rural areas to address HIV/AIDS using citizen media? The content published on blogs can be written, filmed, photographed, and recorded offline, then uploaded whenever Internet access is available. Other forms of citizen media – radio, mobile phones, and the arts – are also important tools.

How can we use media tools to form social movements for change? HIV/AIDS is both a personal and a public health challenge. Because of its wide-ranging impact on so many aspects of life and at so many levels of society, it is something around which a social movement can easily form. Bloggers might be encouraged to see their work linked to a larger whole, as new media connects groups locally, nationally, and around the world. Positive bloggers can connect with one another and also with other issues-based groups. Blogging can be equally effective in reaching out to those with little or no HIV/AIDS awareness – or those with a different perspective about the pandemic – to build bridges and promote dialogue.

How do we approach and involve institutions and health professionals? Blogging can be promoted as a form of therapy for their clients and staff, and institutions can be encouraged to blog about their successes, needs, and challenges. Some institutions and health professionals may be able to train new bloggers, and can provide educational materials for bloggers to convey HIV/AIDS-related information to others. Institutions might provide access to the Internet, and bloggers in turn could form a corps of peer educators, working in tandem with the institution to improve personal and public health.

How can we promote and develop blogging so that it encourages people to see themselves as leaders? If each person understands that his or her blogging voice is unique and might inspire others to better understand the issue or to become active in addressing HIV/AIDS, they will hopefully have incentive to continue speaking out.

Digital Memory Books

Ugandans training for the "Memory Book" project, which teaches HIV-positive parents to communicate with their children about the difficult issues of HIV status, death, and estate planning. Families construct Memory Books to document family history.

The "Memory Book" project began with terminally-ill African immigrant parents in the United Kingdom who did not want their children to forget their personal and cultural heritage. Traditionally memory books are made with paper, photographs, and sometimes newspaper clippings. Creating a digital memory book allows family and friends to also include video, their favorite songs, family genealogies, digital photographs, and text.

A training program has spread the memory book project throughout Uganda, and partnerships have helped extend its use to other African countries, including Kenya, Zambia, Zimbabwe, Ethiopia, Tanzania and South Africa.

After creating a memory book one participant explained: "I am not worried about the future. The Memory Book and training have helped me explain to my children that I am positive and that one day I will die, so I have been able to prepare them. But I also explain that everyone dies one day, and I am just the same."

AZUR Development and AIDS Rights Congo

In the Republic of the Congo, AZUR Development trains communication officers of local HIV/AIDS organizations in digital storytelling, podcasting, and blogging to document the discrimination suffered by people infected and affected by HIV/AIDS.

These stories are used as a tool for advocacy, education, and promotion of the rights of HIV-positive individuals. Each communication officer describes how the HIV/AIDS pandemic is currently affecting the local community where he or she works, and what daily life is like for people living with HIV/AIDS. The project is called AIDS Rights Congo.

In 2006, AZUR Development carried out a project looking at the psychological and social supports for 100 people with HIV/AIDS. Most of these people were women living in Pointe-Noire, Congo. Through the project they discovered the extent to which these women had been dispossessed of their property, and abandoned by their spouses and families. The project kicked off AZUR Development's work on advancing the rights of people living with HIV. They also coordinate the AIDS Network Africa, where they use a blog to recount stories, testimonies, and activities on HIV/AIDS and malaria from the network's members. They have conducted numerous workshops on the use of computers and the Internet.

azurdev.org/en | azurweb.blogspot.com | aidsrightscongo.org

Kwa Mashu Community Advancement Projects

In 1998, 36-year-old Gugu Dlamini was stoned to death by several men in Kwa Mashu, a township of Durban, South Africa. Before her death, she had publicly declared her HIV-positive status at an AIDS awareness gathering. Many believe her death was the direct result of her breaking the silence about her health status.

In hopes of preventing such tragedies, the Kwa Mashu Community Advancement Project (K-CAP) has trained 20 youth from the township to become citizen journalists reporting on local health issues, particularly those related to HIV/AIDS. Roughly 5.7 million people in South Africa are living with HIV/AIDS, and 350,000 people died of the disease in 2007. K-CAP is based in a part of Kwa Mashu Township where HIV/AIDS prevalence is highest.

<http://www.kcap.co.za> | <http://is.gd/1B7gM>

Blogging is an empowering medium precisely because anyone can do it, though a supportive environment can be essential for confidence-building and skills-acquisition. Leadership flows from feelings of ownership.

How can we link HIV-positive bloggers and people blogging on HIV/AIDS-related topics?

Bloggers themselves, and institutions or organizations they are linked with, can make those networking connections. Organizations, institutions, and individuals who work with people who are affected or infected can create links within their own settings, and also engage in outreach to others. Rising Voices has developed a map – with details on HIV/AIDS-related blogs and bloggers across the globe – that will hopefully be one useful tool.

How do we address fear of the unknown related to blogging for the first time?

Starting off with a less-challenging topic and working up to addressing HIV/AIDS may be the best way to address a fear of the unknown. However, sometimes people will feel an urgency to address the topic, especially if it has an impact on their own lives. The regular practice of blogging, combined with a supportive environment and capacity-building activities, should lessen fear and replace it with self-confidence, or at least an openness to learning and developing new skills.

How can we get people to blog on their own, as well as teach others?

A balance of self-expression and peer education is important. Ask people to set aside time to blog on a regular basis, and help them to find outlets for their work. Encourage people to think of themselves as leaders, and help them understand how valuable and essential peer education is, both for the prevention of HIV/AIDS and for the general well-being of themselves, their families, and communities. Placing their own efforts within this larger context will hopefully inspire people to want to share, teach, and lead efforts to address HIV/AIDS, and other challenges to sustainable human development.

Legal Issues

A best practice for all bloggers is to not post anything online that you would not say in person. Though it is extraordinarily rare, bloggers can be sued for defamation and libel if they make false claims about a person or group which damages their reputation.

Quotes and Excerpts from Positive Bloggers

just for kiks

"I began reading more about the virus and the people who have it. I am one of those now and I should learn how to deal with it. Fighting an unknown enemy is surely a battle lost at the onset. I talked to friends of friends and we formed a group. We talked about a variety of issues and situations and experiences: diets, vitamins, those cocktails of pills and capsules they take everyday and which I dread to take soon, a healthy sex life, sex and responsibility, drugs and why we should never take them, reaching out to young people, reaching out to people who don't have it, reaching out to people who don't know anything about it. And yes, reaching out to people who don't want to understand it."

Justin's HIV Journal

As all of you know I'm very outspoken about who I am and about HIV Awareness, Prevention and Education. When I found out about my status I didn't know what to do, but I knew I had to do something to get help and to help others. So I came up with *Justin's HIV Journal*. My family was supportive but I only disclosed to the people that were old enough to understand the disease. I have two little brothers who I love dearly, named Brandon and Josh. They are younger than me, so I felt like I had to protect them or at least their image of me.

Once you become open about your HIV status it's open to just about anyone, especially if you're an outspoken HIV activist like me, who doesn't mind sharing that about themselves. Brandon and Josh, I know you found out about my HIV through the Internet, I just wanted to tell you that I love you both and that it's okay, I'm doing fine."

有了愛滋~還能擁有愛嗎?

Description: For 3 years, Guan De has posted and shared his HIV-positive life with love stories on his blog.

He is brave and optimistic about his situation. He still desires to love and to be loved.

Location: Taiwan

<http://mypaper.pchome.com.tw/news/lmo861/>

Autobiography of an HIV Positive

"While staying in Kathmandu, I heard about an NGO who provides care and teaches about HIV/AIDS. I joined and started taking many classes. It has shown me positive aspects of life. They told me that HIV/AIDS can't be fully cured, but that there are drugs which can help to slow the decreasing rate of our immune systems and help us to live longer as healthy people. It's distributed freely at the government hospital. We can live many years just as other non-infected people live. It makes me so happy. My husband and I started antiretroviral drug treatment there. Their teaching and programs give me a vibrant energy. It breaks many of the myths of HIV/AIDS that I had. It has given more happiness to my life, which I had lost many years ago. Then I began to think, why aren't these types of programs available in our rural village, Achham, and I told myself that I will start one in my village."

(Edited for clarity)

Location: Nepal

Back in the Closet

"Back in June 2008, if I remember right, I got my first CD4 count when I was still with the San Lazaro Hospital. It was 343. By August, I was able to transfer to the RITM, where they took new baseline data. My CD4 had gone down to 328. Down 15 points in just 2 months. I attribute that to the stress and anxiety brought about by the ultimatum presented to me at San Lazaro; that I needed to tell someone in my family, before they started me on antiretrovirals. Something I just wasn't prepared to do."

Location: Philippines

<http://backinthecloset.blogspot.com/>

It is important to never reveal anyone's HIV status online unless you have been given permission to do so. A "Code of Conduct" for bloggers and blogging has been proposed, and is available at <http://www.is.gd/1CaWG>. Blogger.com has published guidelines for its blogs and bloggers [blogger.com/content.g] that balance freedom of expression with responsibility and respect towards others. Among the content they will not allow are various types of pornography; hateful and violent remarks; clear copyright infringements; private and confidential information; content that promotes dangerous or illegal activities; and content from anyone trying to impersonate someone else.

More legal resources for bloggers are available at citimedialaw.org/legal-guide

Getting Started: Resources for New Bloggers

There are literally hundreds of tutorials and guides that explain the basics of blogging and all aspects of digital media. Anytime you have a question you can go to <http://google.com>, type in your question and click on the search button. You can almost always find an answer to your question. In this section we will link to a few guides that should help you get started.

Choosing blogging software. The first step is to choose a service to host your blog. Two of the most popular (and free!) blogging services are <http://wordpress.com> and <http://blogger.com>. Blogger is owned by Google and integrates nicely with other Google products. WordPress is based on open-source software and offers its users slightly more customization. Both services are great, and you can always switch from one to the other. Bloggers based in Africa might want to consider <http://maneno.org>, which is aimed specifically at African bloggers in areas with slow Internet connections. It also has a focus on multilingualism and translation.

Beyond Blogging: Other Useful Tools

While this guide focuses on blogging to address HIV/AIDS, there are many other online tools to further advocacy campaigns, spread awareness, and build a network of peers. Networking sites like Facebook [<http://www.facebook.com>], MySpace [<http://www.myspace.com>], and Kabissa [<http://www.kabissa.org>] allow individuals and organizations to create profiles

HIV Information for Myanmar

Jamie Uhrig, a health activist, blogger, and the moderator of *HIV Information for Myanmar* (<http://him.civiblog.org/>) offers some tips for "blogging and beyond," especially in places where Internet access is very slow or non-existent.

"Blogs are wonderful tools that can serve a lot of people," says Uhrig, but cautions that they are sometimes "harder to access for community members in many developing parts of the world," especially when video and heavy graphics are included. Uhrig also notes that some oppressive governments block access to content they disapprove of, and that it is important in such cases to think of alternative channels of distribution like email. (For more tips on blogging anonymously and circumventing censorship please see our "Blogging Anonymously" guide linked to on page 1.)

Blog posts can be copied and pasted into email messages and sent to dozens of recipients. Uhrig stresses that Google's Gmail can be made secure so that governments and prying eyes can't see your messages:

http://him.civiblog.org/blog/_archives/2008/12/2/4003413.html

Uhrig also encourages fellow activists to take advantage of mobile phones. Skype [www.skype.com] can be used to easily send many text messages to mobile phones all over the world at an affordable price. FrontlineSMS [<http://www.frontlinesms.com>] is a text-messaging system that allows NGOs to communicate with dozens or even hundreds of peers instantly. All it requires is a computer and mobile phone.

acid reflux

HIV's FIRST BLOG REALITY SHOW

STILL HERE
AND CAUGHT
IN THE ACT

Advice From a Veteran Blogger

Brian Finch is an HIV-positive Canadian blogger, social activist, humorist, and creator of "Acid Reflux," dubbed "HIV's First Blog Reality Show" <http://acidrefluxweb.com>

"The Internet facilitates technological activism. It gives control and voice to the individual, to express oneself in the way he or she deems fit. It is taking back power, creating a voice that is not defined by others. Personally, it is a way to define myself outside of the small box of HIV, to exist outside of the disease paradigm.

"The more people are writing openly about their status, the more other people will see that they too can take risks. An online, 'open' presence serves as a role model for others.

"There is no HIV/AIDS-related community history, let alone a history that is international. Most countries are very inward-looking. The Internet has helped to break that down. For example, a website can be seen by people around the world. For women in particular, in Africa and beyond, the Internet has been an amazing networking and support tool.

"Goals are very individualized. When one is beginning to be open about his or her status, the goals may be as much internal as external. One goal may be about improving coverage of HIV/AIDS, and encouraging general awareness. Another may be an act of empowerment, to challenge others or even your own community – however you define that – on notions of what it means to be HIV-positive. This is why I use humor in my own work and push boundaries.

"I find that many people like to write about how they got to where they are at that point and time. It's hard to set a best practice, but I'd recommend starting to write what you would say in any conversation. An introduction and background come first. Then answer more questions: Why are you writing? What do you hope to get out of it? What is

your history? What are the things we should know about you, to see you as a whole person, to feel a connection with you? Why should we want to come back and find out more?

"Humor is a way of reclaiming power ... I've seen HIV-negative individuals try to define and label us as many things. There is one thing we are definitely not supposed to be, and that is visible...having fun in life, while all the time being an activist by virtue of making oneself public. Humor has always gotten me through life, especially some of the toughest moments. When I found out I was HIV-positive, over twenty years ago, I didn't know whether to cry or laugh. I chose to laugh as much as I possibly could. Dark humor became my best friend. I love it because it shocks, while giving me courage in the face of adversity. Humor was and continues to be a powerful weapon to confront the painful realities in our lives. It takes the awful and twists it around into an absurdity so exaggerated, it actually becomes funny."

(For an example of Finch's use of humor, see *Positively HIV-larious*, <http://acidrefluxweb.com/?cat=184>, Edition #364, January 21 -February 4, 2009)

and find others at a local, national, or international level with similar interests.

DigiActive [www.digiactive.org] has published a number of guides on using social networking tools for advocacy campaigns. Tactical Technology Collective [www.tacticaltech.org] has quality guides that explain how to use free and open-source software for activists. Mobile Active [<http://mobileactive.org>] focuses on using mobile phones to create social change and improve healthcare.

Blog search engines like Technorati [<http://technorati.com>] can help promote your blog and assist in finding other blogs that interest you.

Join the Global Conversation

Now that you know the basics of blogging, it's time to join the global conversation. Global Voices is a community of citizen media enthusiasts from around the world which aggregates, curates, and amplifies the international online conversation. Whether you're looking for podcasts from Japan or captivating photos from Macedonia, Global Voices is an online village of everyday people sharing stories, photographs, and opinions from their corner of the world to yours. We hope that you take part in the conversation.

www.globalvoicesonline.org

Blogging Positively: Get Involved

There are many ways to become involved in the Blogging Positively community. If you would like to be included on our map of HIV-positive bloggers around the world please email Global Voices' Public Health Editor [Juhie Bhatia](mailto:Juhie.Bhatia@globalvoicesonline.org) [<http://globalvoicesonline.org/author/juhie-bhatia/>] with a link to your blog and the city you live in. We also encourage you to subscribe to the [Blogging Positively mailing list](http://groups.google.com/group/rv-positively) [<http://groups.google.com/group/rv-positively>]

Acknowledgements

Greatest thanks to all who participated in the development of the guide, including the chat sessions that formed the foundation of the "Blogging Positively" project. Special appreciation goes to: David Sasaki, Solana Larsen, and

Juhie Bhatia of Rising Voices and Global Voices; Daudi Were (Kenyan Blogs Webring, KenyaUnlimited, and Mental Acrobatics), and Serina Kalande, the Kenyan bloggers who together proposed and birthed the project; Dennis Kimambo and Collins Oduor of REPACTED (Kenya); Andrius Kulikauskas of the Minciu Sodas Laboratory for Independent Thinkers (Lithuania); Maureen Agena of WOUGNET (Uganda); Sylvie Niombo of AZUR Development (Republic of the Congo); Brian Finch (Acid Reflux, Canada); Louise Binder (International Community of Women Living with HIV/AIDS, Canadian Treatment Action Council, Canada); Jamie Uhrig of HIM (USA and Myanmar), Dhojo Wahengbam of the HIV-Network (India), and Tobias Eigen of Kabissa (Africa).

The chat participants included: Glenna Gordon, Amira Hussaini, Deborah Dilley, Eduardo Avila, Salam Adil, Jeremy Clarke, Jillian York, Mialy Andriamananjara, Ljubisa Bojic, Jogany, Mary Joyce, Fred Kayiwa, Luihamu Ringo, Taline Haytayan, Himakshi Piplani, Eric Bleich, Nekesa Were, Lova Rakotomalala, Anas, Patrick Karanja, Victor Ngeny, Rezwan, Sylwia Presley, Senfuka Samuel, Tom Ochuka, Wendi Losha Bernadette, Teekay Ndiba, James Leahy, Sasha Mrkailo, Leah Okeyo, Zoneziwoh Mbongdulo, Konate Boukary, Leung, Stephen McGill, Kiyavilo Msekwa, Veronica Kalambi.

Daudi Were (Mental Acrobatics, <http://www.mentalacrobatics.com/think/>) coined the project title, "Blogging Positively," for which we are deeply grateful. Andrius Kulikauskas and the Minciu Sodas Laboratory generously provided free chat space for our gatherings, which generated the bulk of material for the Guide. Solana Larsen and Juhie Bhatia have been instrumental in the creation of the "Blogging Positively" map, and Juhie wrote some of the original "Case Studies" material for the Rising Voices website. David Sasaki has been an ever-present source of support, helpful feedback, and "shepherding" spirit. Serina Kalande has been a "keeper of the flame," helping us to see this endeavor through, from start to finish.

Blogging for Healthier Policy in Ukraine

Pavel Kutsev, a leader in Ukraine's harm reduction movement and co-founder of the non-profit organization Drop-in Center, uses his blog to fight stigma and to create awareness about the health needs of Ukrainians living with drug addiction and HIV/AIDS. Pavel defends the rights of drug users who participate in substitution therapy programs, which aim to discourage drug users from injecting street drugs with needles, thus mitigating the spread of the HIV/AIDS pandemic.

Kutsev, who is HIV-positive, knows first-hand the stigma and discrimination that face drug users and HIV-positive individuals. On his blog Pavel covers the various issues that are discussed in the Ukrainian community of injection drug users, including types of medication, health support services, and political activism to overturn recent decisions in some Ukrainian municipalities to ban substitution therapy. In addition, Kutsev posts his own autobiographical stories in order to share the lessons he has learned with his readers.

Kutsev says that blogging has helped him and his organization to be heard, and to become more influential. He has been invited to participate as an expert in working groups tasked with the development of the government's substitution therapy policy, and believes that Ukraine's Ministry of Health introduced its current policy of making some replacement therapy medications available at drug stores as a response to discussions in the Ukrainian blogosphere. Kutsev is working toward a global web-resource to unite the efforts of harm reduction activists that promote replacement therapy as a way to mitigate the spread of HIV/AIDS.
